15 Background

Molecular chaperones maintain the appropriate folding and conformation of proteins and are crucial in regulating the balance between protein synthesis and degradation. They have been shown not only to play a vital role in the cellular  
20 stress response but also to be important in regulating many important cellular functions, such as cell proliferation and apoptosis (Jolly and Morimoto, 2000; Smith et al., 1998; Smith, 2001).

Heat Shock Proteins (HSPs)

25 Exposure of cells to a number of environmental stresses, including heat shock, alcohols, heavy metals and oxidative stress, results in the cellular accumulation of a number of chaperones, commonly known as heat shock proteins (HSPs). This effect is mediated by the transcription factor heat shock factor 1 (HSF1) and  
30 is termed the 'heat shock response' (Morimoto, 1998). Induction of HSPs protects the cell against the initial stress insult, enhances recovery and leads to maintenance of a stress tolerant state. It has also become clear, however, that certain HSPs may also play a major molecular chaperone role under normal,

- 2 -

stress-free conditions by regulating the correct folding, degradation, localization and function of a growing list of important cellular proteins.

A number of multigene families of HSPs exist, with individual gene products  
5 varying in cellular expression, function and localization. They are classified according to molecular weight, e.g., HSP70, HSP90, and HSP27. Exceptions to this nomenclature rule are a small subset of chaperones that were identified as glucose regulated proteins, e.g., GRP94 and GRP75.

10 Several diseases in humans can be acquired as a result of protein misfolding (reviewed in Tytell et al., 2001; Smith et al., 1998). Hence the development of therapies which disrupt the molecular chaperone machinery may prove to be beneficial. In some conditions (e.g., Alzheimer's disease, prion diseases and Huntington's disease), misfolded proteins can cause protein aggregation resulting  
15 in neurodegenerative disorders. Also, misfolded proteins may result in loss of wild type protein function, leading to deregulated molecular and physiological functions in the cell.

HSPs have also been implicated in cancer. For example, there is evidence of  
20 differential expression of HSPs which may relate to the stage of tumour progression (Martin et al., 2000; Conroy et al., 1996; Kawanishi et al., 1999; Jameel et al., 1992; Hoang et al., 2000; Lebeau et al., 1991). As a result of the involvement of HSP90 in various critical oncogenic pathways and the discovery that certain natural products with anticancer activity are targeting this molecular  
25 chaperone, the fascinating new concept has been developed that inhibiting HSP function may be useful in the treatment of cancer. The first molecular chaperone inhibitor is currently undergoing clinical trials.

### HSP90

30

HSP90 constitutes about 1-2% of total cellular protein, and is usually present in the cell as a dimer in association with one of a number of other proteins (see, e.g., Pratt, 1997). It is essential for cell viability and it exhibits dual chaperone

functions (Young et al., 2001). It plays a key role in the cellular stress response by interacting with many proteins after their native conformation has been altered by various environmental stresses, such as heat shock, ensuring adequate protein folding and preventing non-specific aggregation (Smith et al., 1998). In addition, recent results suggest that HSP90 may also play a role in buffering against the effects of mutation, presumably by correcting the inappropriate folding of mutant proteins (Rutherford and Lindquist, 1998). However, HSP90 also has an important regulatory role. Under normal physiological conditions, together with its endoplasmic reticulum homologue GRP94, HSP90 plays a housekeeping role in the cell, maintaining the conformational stability and maturation of several key client proteins. These can be subdivided into three groups: (a) steroid hormone receptors, (b) Ser/Thr or tyrosine kinases (e.g., ERBB2, RAF-1, CDK4, and LCK), and (c) a collection of apparently unrelated proteins, e.g., mutant p53 and the catalytic subunit of telomerase hTERT. All of these proteins play key regulatory roles in many physiological and biochemical processes in the cell. New HSP90 client proteins are continuously being identified.

The highly conserved HSP90 family in humans consists of four genes, namely the cytosolic HSP90 $\alpha$  and HSP90 $\beta$  isoforms (Hickey et al., 1989), GRP94 in the endoplasmic reticulum (Argon et al., 1999) and HSP75/TRAP1 in the mitochondrial matrix (Felts et al., 2000). It is thought that all the family members have a similar mode of action, but bind to different client proteins depending on their localization within the cell. For example, ERBB2 is known to be a specific client protein of GRP94 (Argon et al., 1999) and type 1 tumour necrosis factor receptor (TNFR1) and RB have both been shown to be clients of TRAP1 (Song et al., 1995; Chen et al., 1996).

HSP90 participates in a series of complex interactions with a range of client and regulatory proteins (Smith, 2001). Although the precise molecular details remain to be elucidated, biochemical and X-ray crystallographic studies (Prodromou et al., 1997; Stebbins et al., 1997) carried out over the last few years have provided increasingly detailed insights into the chaperone function of HSP90.

The monomer of HSP90 consists of conserved 25 kDa N terminal and 55 kDa C terminal domains joined together by a charged linker region (not present in TRAP1) (Prodromou and Pearl, 2000a). Both the N and C termini of HSP90 are reported to bind to substrate polypeptides including client proteins and co-

5 chaperones. The N terminus contains an unusual ATP binding site that has structural homology with type II topoisomerase gyrase B, an N-terminal fragment of the MutL DNA mismatch repair protein and a C-terminal fragment of the histidine kinase Che A (Prodromou and Pearl, 2000a).

10 Following earlier controversy on this issue, it is now clear that HSP90 is an ATP-dependent molecular chaperone (Prodromou et al, 1997), with dimerization of the nucleotide binding domains being essential for ATP hydrolysis, which is in turn essential for chaperone function (Prodromou et al, 2000a). Binding of ATP results in the formation of a toroidal dimer structure in which the N terminal

15 domains are brought into closer contact with each other resulting in a conformational switch known as the 'clamp mechanism' (Prodromou and Pearl, 2000b).

The function of HSP90 is regulated by association with a number of co-

20 chaperones that combine in various ways to form a series of multimeric protein complexes. Interactions with these various partners in different heterocomplexes may be restricted by temporal, spatial and biochemical factors. A number of these cochaperones contain a tetracopeptide repeat and binding of these proteins to HSP90 has been localised to the C terminal MEEVD motif

25 (Prodromou and Pearl, 2000a).

A number of reviews describe in detail the molecular chaperone role of HSP90 and its importance in the conformational stability and function of the currently identified client proteins (Scheibel et al, 1998; Smith et al., 2001).

### Known HSP90 Inhibitors

The first class of HSP90 inhibitors to be discovered was the benzoquinone ansamycin class, which includes the compounds herbimycin A and geldanamycin.

Herbimycin A

Geldanamycin (R = OMe)

These agents are natural products, initially isolated from actinomycete broths (DeBoer, 1970). However, it was not until the 1980s that their potential application as antitumour agents was discovered. They were shown to reverse the malignant phenotype of fibroblasts transformed by the *v-Src* oncogene (Uehara et al., 1985), and subsequently to exhibit potent antitumour activity in both *in vitro* (Schulte et al., 1998) and *in vivo* animal models (Supko et al., 1995).

Initially, the benzoquinone ansamycins were thought to act as tyrosine kinase inhibitors. However, it has since transpired that depletion of oncogenic protein kinases via the ubiquitin proteasome pathway, rather than inhibition of their catalytic activity, is predominantly responsible for their antitumour activity.

Subsequent immunoprecipitation and affinity matrix studies have shown that the major mechanism of action of geldanamycin involves binding to HSP90 (Whitesell et al., 1994; Schulte and Neckers, 1998). Moreover, X-ray crystallographic studies have shown that geldanamycin competes at the ATP binding site and inhibits the intrinsic ATPase activity of HSP90 (Prodromou et al., 1997; Panaretou et al., 1998). This in turn prevents the formation of mature

multimeric HSP90 complexes capable of chaperoning client proteins. As a result, the client proteins are targeted for degradation via the ubiquitin proteasome pathway. Recent results suggest that this involves the recruitment of other regulatory proteins - such as the ubiquitin ligase, carboxy terminus of HSC70  
5 interacting protein (CHIP) - to the HSP90 complex (Connell et al., 2001). The particular functions of these HSP90 client proteins and how they may be affected by HSP90 inhibition is discussed in two earlier reviews on HSP90 inhibitors (Neckers et al., 1999; Ochel et al., 2001).

10 Geldanamycin showed activity in human tumour xenograft models but progression of this compound to clinical trial was halted due to unacceptable levels of hepatotoxicity which was seen at doses required for therapeutic activity (Supko et al, 1995). However, following screening of a range of geldanamycin analogues at the US National Cancer Institute (NCI) it was discovered that 17-allylamino, 17-demethoxygeldanamycin (17AAG) retains the property of HSP90  
15 inhibition resulting in client protein depletion and antitumour activity in cell culture and xenograft models (Schulte et al, 1998; Kelland et al, 1999), but has significantly less hepatotoxicity than geldanamycin (Page et al, 1997). 17AAG is currently being evaluated in Phase I clinical trials using a number of different  
20 scheduling regimens under the auspices of the NCI and the UK Cancer Research Campaign (CRC).

17AAG (R = NHCH<sub>2</sub>CH=CH<sub>2</sub>)

A range of geldanamycin analogues has already been described (Schnur et al, 1995a and b), of which 17AAG appeared to be the most promising in terms of  
25 therapeutic index. The clinical development of 17AAG and the search for

- 7 -

additional analogues that may have improved pharmaceutical properties (e.g., solubility, oral bioavailability) and different pharmacological behaviour (Sybert and Spiegel, 2001) continues. Structure-activity relationships (SAR) with 17AAG analogues have shed more light on the chemical features required for HSP90 inhibitory activity and also for the NQO1 potentiation effect (Schnur et al, 1995a and b, Maloney et al, 1999).

Radicicol is a macrocyclic antibiotic isolated from *Monosporium bonorden*. It was shown to reverse the malignant phenotype of v-*Src* and v-*Ha-Ras* transformed fibroblasts (Kwon et al, 1992; Zhao et al, 1995).

Like the benzoquinone ansamycins, radicicol was at first thought to act as a tyrosine kinase inhibitor. However, it was shown subsequently to degrade a number of signalling proteins as a consequence of HSP90 inhibition (Schulte et al., 1998). X-ray crystallographic data confirmed that radicicol also binds to the N terminal domain of HSP90 and inhibits the intrinsic ATPase activity (Roe et al., 1998). Interestingly, radicicol is more potent at inhibiting HSP90 ATPase activity compared to geldanamycin and 17AAG (Panaretou et al., 1998), even though they have similar growth inhibitory effects on tumour cells. This may be a consequence of differences in the cellular uptake or metabolism of these compounds. Radicicol binds to all HSP90 family members, although it has a weaker binding affinity to both GRP94 and TRAP1 than the cytosolic HSP90 isoforms (Schulte et al., 1999).

However, like 17AAG, the structure of radicicol has a number of adverse pharmacological properties that could lead to unfavourable metabolism. These include an epoxide residue, keto group, two phenolic hydroxyl groups and Michael acceptor. Radicicol lacks antitumour activity *in vivo* due to the unstable

chemical nature of the compound. Oxime derivatives of radicicol (KF25706 and KF58333) have been synthesised which retain the HSP90 inhibitory activity of radicicol, and KF25706 has been shown to exhibit *in vivo* antitumour activity in human tumour xenograft models (Soga et al., 1999).

5

Coumarin antibiotics are known to bind to bacterial DNA gyrase at an ATP binding site homologous to that of the HSP90. The coumarin, novobiocin, was shown to bind to the carboxy terminus of HSP90, i.e., at a different site to that occupied by the benzoquinone ansamycins and radicicol which bind at the N-terminus (Marcu et al., 2000b). However, this still resulted in inhibition of HSP90 function and degradation of a number of HSP90-chaperoned signalling proteins (Marcu et al., 2000a). Geldanamycin cannot bind HSP90 subsequent to novobiocin; this suggests that some interaction between the N and C terminal domains must exist and is consistent with the view that both sites are important for HSP90 chaperone properties.

15

20

A purine-based HSP90 inhibitor, PU3, has been synthesized based on rationale drug design with the aid of the X-ray crystal structure (Chiosis et al., 2001). This agent was shown to result in the degradation of signalling molecules, including ERBB2, and to cause cell cycle arrest and differentiation in breast cancer cells (Chiosis et al., 2001). Although less potent than 17AAG, it is more soluble and so may be formulated in more conventional vehicles and could potentially have more favourable oral bioavailability.

### HSP90 as a Therapeutic Target

5 Due to its involvement in regulating a number of signalling pathways that are crucially important in driving the phenotype of a tumour, and the discovery that certain bioactive natural products exert their effects via HSP90 activity, the molecular chaperone HSP90 is currently being assessed as a new target for anticancer drug development (Neckers et al., 1999).

10

The predominant mechanism of action of geldanamycin, 17AAG, and radicicol involves binding to HSP90 at the ATP binding site located in the N-terminal domain of the protein, leading to inhibition of the intrinsic ATPase activity of HSP90 (see, e.g., Prodromou et al., 1997; Stebbins et al., 1997; Panaretou et al.,

15

1998).

Inhibition of HSP90 ATPase activity prevents recruitment of co-chaperones and encourages the formation of a type of HSP90 heterocomplex from which these client proteins are targeted for degradation via the ubiquitin proteasome pathway

20

(see, e.g., Neckers et al., 1999; Kelland et al., 1999).

Treatment with HSP90 inhibitors leads to selective degradation of important proteins involved in cell proliferation, cell cycle regulation and apoptosis, processes which are fundamentally important in cancer.

25

Inhibition of HSP90 function has been shown to cause selective degradation of important signalling proteins involved in cell proliferation, cell cycle regulation and apoptosis, processes which are fundamentally important and which are

commonly deregulated in cancer (see, e.g., Hostein et al., 2001). An attractive rationale for developing drugs against this target for use in the clinic is that by simultaneously depleting proteins associated with the transformed phenotype, one may obtain a strong antitumour effect and achieve a therapeutic advantage

- 5 against cancer versus normal cells. These events downstream of HSP90 inhibition are believed to be responsible for the antitumour activity of HSP90 inhibitors in cell culture and animal models (see, e.g., Schulte et al., 1998; Kelland et al., 1999).
- 10 Khilya et al., 1994, describe the synthesis of a number of 3,4-diaryl pyrazoles (see the following table), by reaction of isoflavones with benzodioxolane ( $n=1$ ), benzodioxane ( $n=2$ ), or benzodioxepane ( $n=3$ ) upon boiling in alcohol with hydrazine hydrate. However, nowhere in the document is there provided any teaching of possible uses of these compounds.

#### Includes Other Forms

5

Unless otherwise specified, included in the above are the well known ionic, salt, solvate, and protected forms of these substituents. For example, a reference to carboxylic acid (-COOH) also includes the anionic (carboxylate) form (-COO<sup>-</sup>), a salt or solvate thereof, as well as conventional protected forms. Similarly, a reference to an amino group includes the protonated form (-N<sup>+</sup>HR<sup>1</sup>R<sup>2</sup>), a salt or solvate of the amino group, for example, a hydrochloride salt, as well as conventional protected forms of an amino group. Similarly, a reference to a hydroxyl group also includes the anionic form (-O<sup>-</sup>), a salt or solvate thereof, as well as conventional protected forms of a hydroxyl group.

#### Isomers, Salts, Solvates, Protected Forms, and Prodrugs

Certain compounds may exist in one or more particular geometric, optical, enantiomeric, diastereomeric, epimeric, atropic, stereoisomeric, tautomeric, conformational, or anomeric forms, including but not limited to, cis- and trans-forms; E- and Z-forms; c-, t-, and r- forms; endo- and exo-forms; R-, S-, and meso-forms; D- and L-forms; d- and l-forms; (+) and (-) forms; keto-, enol-, and enolate-forms; syn- and anti-forms; synclinal- and anticlinal-forms; α- and β-forms; axial and equatorial forms; boat-, chair-, twist-, envelope-, and halfchair-forms; and combinations thereof, hereinafter collectively referred to as "isomers" (or "isomeric forms").

Note that, except as discussed below for tautomeric forms, specifically excluded from the term "isomers," as used herein, are structural (or constitutional) isomers (i.e., isomers which differ in the connections between atoms rather than merely by the position of atoms in space). For example, a reference to a methoxy group, -OCH<sub>3</sub>, is not to be construed as a reference to its structural isomer, a hydroxymethyl group, -CH<sub>2</sub>OH. Similarly, a reference to ortho-chlorophenyl is not

to be construed as a reference to its structural isomer, meta-chlorophenyl. However, a reference to a class of structures may well include structurally isomeric forms falling within that class (e.g., C<sub>1-7</sub>alkyl includes n-propyl and iso-propyl; butyl includes n-, iso-, sec-, and tert-butyl; methoxyphenyl includes ortho-, meta-, and para-methoxyphenyl).

The above exclusion does not pertain to tautomeric forms, for example, keto-, enol-, and enolate-forms, as in, for example, the following tautomeric pairs: keto/enol (illustrated below), imine/enamine, amide/imino alcohol, amidine/amidine, nitroso/oxime, thioketone/enethiol, N-nitroso/hydroxyazo, and nitro/aci-nitro.

It will be appreciated that when R<sup>N</sup> is hydrogen, the pyrazoles of the present invention may exist in tautomeric forms as illustrated below. For the avoidance of doubt, both tautomeric forms are encompassed by the present invention and reference to one tautomeric form includes reference to the other.

Note that specifically included in the term "isomer" are compounds with one or more isotopic substitutions. For example, H may be in any isotopic form, including <sup>1</sup>H, <sup>2</sup>H (D), and <sup>3</sup>H (T); C may be in any isotopic form, including <sup>12</sup>C, <sup>13</sup>C, and <sup>14</sup>C; O may be in any isotopic form, including <sup>16</sup>O and <sup>18</sup>O; and the like.

- 99 -

Unless otherwise specified, a reference to a particular compound includes all such isomeric forms, including (wholly or partially) racemic and other mixtures thereof. Methods for the preparation (e.g., asymmetric synthesis) and separation (e.g., fractional crystallisation and chromatographic means) of such isomeric forms are either known in the art or are readily obtained by adapting the methods taught herein, or known methods, in a known manner.

Unless otherwise specified, a reference to a particular compound also includes ionic, salt, solvate, and protected forms of thereof, for example, as discussed below.

It may be convenient or desirable to prepare, purify, and/or handle a corresponding salt of the active compound, for example, a pharmaceutically-acceptable salt. Examples of pharmaceutically acceptable salts are discussed in Berge et al., 1977, "Pharmaceutically Acceptable Salts," J. Pharm. Sci., Vol. 66, pp. 1-19.

For example, if the compound is anionic, or has a functional group which may be anionic (e.g., -COOH may be  $\text{-COO}^-$ ), then a salt may be formed with a suitable cation. Examples of suitable inorganic cations include, but are not limited to, alkali metal ions such as  $\text{Na}^+$  and  $\text{K}^+$ , alkaline earth cations such as  $\text{Ca}^{2+}$  and  $\text{Mg}^{2+}$ , and other cations such as  $\text{Al}^{3+}$ . Examples of suitable organic cations include, but are not limited to, ammonium ion (i.e.,  $\text{NH}_4^+$ ) and substituted ammonium ions (e.g.,  $\text{NH}_3\text{R}^+$ ,  $\text{NH}_2\text{R}_2^+$ ,  $\text{NHR}_3^+$ ,  $\text{NR}_4^+$ ). Examples of some suitable substituted ammonium ions are those derived from: ethylamine, diethylamine, dicyclohexylamine, triethylamine, butylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine, benzylamine, phenylbenzylamine, choline, meglumine, and tromethamine, as well as amino acids, such as lysine and arginine. An example of a common quaternary ammonium ion is  $\text{N}(\text{CH}_3)_4^+$ .

If the compound is cationic, or has a functional group which may be cationic (e.g.,  $\text{-NH}_2$  may be  $\text{-NH}_3^+$ ), then a salt may be formed with a suitable anion. Examples of suitable inorganic anions include, but are not limited to, those derived from the

following inorganic acids: hydrochloric, hydrobromic, hydroiodic, sulfuric, sulfurous, nitric, nitrous, phosphoric, and phosphorous.

5 Examples of suitable organic anions include, but are not limited to, those derived from the following organic acids: 2-acetyoxybenzoic, acetic, ascorbic, aspartic, benzoic, camphorsulfonic, cinnamic, citric, edetic, ethanedisulfonic, ethanesulfonic, fumaric, glucheptonic, gluconic, glutamic, glycolic, hydroxymaleic, hydroxynaphthalene carboxylic, isethionic, lactic, lactobionic, lauric, maleic, malic, methanesulfonic, mucic, oleic, oxalic, palmitic, pamoic, pantothenic, 10 phenylacetic, phenylsulfonic, propionic, pyruvic, salicylic, stearic, succinic, sulfanilic, tartaric, toluenesulfonic, and valeric. Examples of suitable polymeric organic anions include, but are not limited to, those derived from the following polymeric acids: tannic acid, carboxymethyl cellulose.

15 It may be convenient or desirable to prepare, purify, and/or handle a corresponding solvate of the active compound. The term "solvate" is used herein in the conventional sense to refer to a complex of solute (e.g., active compound, salt of active compound) and solvent. If the solvent is water, the solvate may be conveniently referred to as a hydrate, for example, a mono-hydrate, a di-hydrate, 20 a tri-hydrate, etc.

It may be convenient or desirable to prepare, purify, and/or handle the active compound in a chemically protected form. The term "chemically protected form" is used herein in the conventional chemical sense and pertains to a compound in 25 which one or more reactive functional groups are protected from undesirable chemical reactions under specified conditions (e.g., pH, temperature, radiation, solvent, and the like). In practice, well known chemical methods are employed to reversibly render unreactive a functional group, which otherwise would be reactive, under specified conditions. In a chemically protected form, one or more 30 reactive functional groups are in the form of a protected or protecting group (also known as a masked or masking group or a blocked or blocking group). By protecting a reactive functional group, reactions involving other unprotected reactive functional groups can be performed, without affecting the protected

group; the protecting group may be removed, usually in a subsequent step, without substantially affecting the remainder of the molecule. See, for example, Protective Groups in Organic Synthesis (T. Green and P. Wuts; 3rd Edition; John Wiley and Sons, 1999).

5

A wide variety of such "protecting," "blocking," or "masking" methods are widely used and well known in organic synthesis. For example, a compound which has two nonequivalent reactive functional groups, both of which would be reactive under specified conditions, may be derivatized to render one of the functional groups "protected," and therefore unreactive, under the specified conditions; so  
10 protected, the compound may be used as a reactant which has effectively only one reactive functional group. After the desired reaction (involving the other functional group) is complete, the protected group may be "deprotected" to return it to its original functionality.

15

For example, a hydroxy group may be protected as an ether (-OR) or an ester (-OC(=O)R), for example, as: a t-butyl ether; a benzyl, benzhydryl (diphenylmethyl), or trityl (triphenylmethyl) ether; a trimethylsilyl or t-butyl dimethylsilyl ether; or an acetyl ester (-OC(=O)CH<sub>3</sub>, -OAc).

20

For example, an aldehyde or ketone group may be protected as an acetal (R-CH(OR)<sub>2</sub>) or ketal (R<sub>2</sub>C(OR)<sub>2</sub>), respectively, in which the carbonyl group (>C=O) is converted to a diether (>C(OR)<sub>2</sub>), by reaction with, for example, a primary alcohol. The aldehyde or ketone group is readily regenerated by  
25 hydrolysis using a large excess of water in the presence of acid.

For example, an amine group may be protected, for example, as an amide (-NRCO-R) or a urethane (-NRCO-OR), for example, as: a methyl amide (-NHCO-CH<sub>3</sub>); a benzyloxy amide (-NHCO-OCH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>, -NH-Cbz); as a t-butoxy  
30 amide (-NHCO-OC(CH<sub>3</sub>)<sub>3</sub>, -NH-Boc); a 2-biphenyl-2-propoxy amide (-NHCO-OC(CH<sub>3</sub>)<sub>2</sub>C<sub>6</sub>H<sub>4</sub>C<sub>6</sub>H<sub>5</sub>, -NH-Bpoc), as a 9-fluorenylmethoxy amide (-NH-Fmoc), as a 6-nitroveratryloxy amide (-NH-Nvoc), as a 2-trimethylsilylethoxy amide (-NH-Teoc), as a 2,2,2-trichloroethoxy amide

- 102 -

(-NH-Troc), as an allyloxy amide (-NH-Alloc), as a 2(-phenylsulphonyl)ethyloxy amide (-NH-Psec); or, in suitable cases (e.g., cyclic amines), as a nitroxide radical ( $>\text{N}-\text{O}\bullet$ ).

- 5 For example, a carboxylic acid group may be protected as an ester for example, as: an  $\text{C}_{1-7}$ alkyl ester (e.g., a methyl ester; a t-butyl ester); a  $\text{C}_{1-7}$ haloalkyl ester (e.g., a  $\text{C}_{1-7}$ trihaloalkyl ester); a tri $\text{C}_{1-7}$ alkylsilyl- $\text{C}_{1-7}$ alkyl ester; or a  $\text{C}_{5-20}$ aryl- $\text{C}_{1-7}$ alkyl ester (e.g., a benzyl ester; a nitrobenzyl ester); or as an amide, for example, as a methyl amide.

10

For example, a thiol group may be protected as a thioether (-SR), for example, as: a benzyl thioether; an acetamidomethyl ether ( $-\text{S}-\text{CH}_2\text{NHC}(=\text{O})\text{CH}_3$ ).

15

It may be convenient or desirable to prepare, purify, and/or handle the active compound in the form of a prodrug. The term "prodrug," as used herein, pertains to a compound which, when metabolised (e.g., in vivo), yields the desired active compound. Typically, the prodrug is inactive, or less active than the active compound, but may provide advantageous handling, administration, or metabolic properties.

20

- For example, some prodrugs are esters of the active compound (e.g., a physiologically acceptable metabolically labile ester). During metabolism, the ester group ( $-\text{C}(=\text{O})\text{OR}$ ) is cleaved to yield the active drug. Such esters may be formed by esterification, for example, of any of the carboxylic acid groups ( $-\text{C}(=\text{O})\text{OH}$ ) in the parent compound, with, where appropriate, prior protection of any other reactive groups present in the parent compound, followed by deprotection if required.
- 25

30

Examples of such metabolically labile esters include those of the formula

$-\text{C}(=\text{O})\text{OR}$  wherein R is:

$\text{C}_{1-7}$ alkyl

(e.g., -Me, -Et, -nPr, -iPr, -nBu, -sBu, -iBu, -tBu);

$\text{C}_{1-7}$ aminoalkyl

- 103 -

(e.g., aminoethyl; 2-(N,N-diethylamino)ethyl; 2-(4-morpholino)ethyl); and  
acyloxy-C<sub>1-7</sub>alkyl

(e.g., acyloxymethyl;

acyloxyethyl;

5 pivaloyloxymethyl;

acetoxymethyl;

1-acetoxyethyl;

1-(1-methoxy-1-methyl)ethyl-carboxyloxyethyl;

1-(benzoyloxy)ethyl; isopropoxy-carboxyloxymethyl;

10 1-isopropoxy-carboxyloxyethyl; cyclohexyl-carboxyloxymethyl;

1-cyclohexyl-carboxyloxyethyl;

cyclohexyloxy-carboxyloxymethyl;

1-cyclohexyloxy-carboxyloxyethyl;

(4-tetrahydropyranyloxy) carboxyloxymethyl;

15 1-(4-tetrahydropyranyloxy)carboxyloxyethyl;

(4-tetrahydropyranyl)carboxyloxymethyl; and

1-(4-tetrahydropyranyl)carboxyloxyethyl).

Also, some prodrugs are activated enzymatically to yield the active compound, or  
20 a compound which, upon further chemical reaction, yields the active compound  
(for example, as in ADEPT, GDEPT, LIDEPT, etc.). For example, the prodrug  
may be a sugar derivative or other glycoside conjugate, or may be an amino acid  
ester derivative.

### General Synthesis

- 10 The 3,4-diarylpyrazoles of the present invention may be prepared, for example, by the methods described herein, or by adapting these or other well known methods in well known ways.

In one method, isoflavones are reacted with hydrazine to yield the corresponding  
15 pyrazole, for example, as illustrated in the following scheme. See, for example, Bass, 1976; Nakano et al., 1979; Baker et al., 1953; and Khilya et al., 1994.

### Scheme 1

20 More generally, 3,4-diarylpyrazoles can be prepared by reaction of a suitably substituted dicarbonyl compound with hydrazine, for example, as illustrated in the following scheme. See, for example, Terrett et al., 1996 and Leigh et al., 1979.

### Scheme 2

The required dicarbonyl compounds can be obtained by various synthetic approaches including the following.

5 In one method, the dicarbonyl compound is prepared by acylation of an aryl benzyl ketone, for example, as illustrated in the following scheme. See, for example, Berk et al., 1988, and Le et al., 1997.

Scheme 3

10

Examples of acylating agent,  $\text{R}^5\text{COX}$ , include esters, acid chlorides, anhydrides, and the like, and reactions may be catalysed, for example, by bases such as metal alkoxides, or by prior formation of an enolate anion, using, for example, lithium di-isopropylamide in tetrahydrofuran at low temperature. Alternatively the  
15 acylating agent may be a formamide or an orthoformate, used in the presence of a Lewis acid catalyst, such as  $\text{BF}_3$ .

The aryl benzyl ketone,  $\text{Ar}^3\text{C}(=\text{O})\text{CH}_2\text{Ar}^4$ , may be replaced by related substrates, such as enol ethers, shown below, where R is, for example, alkyl, trialkylsilyl, and  
20 the like.

In another method, the dicarbonyl compound is prepared by acylation of an alkyl benzyl ketone, for example, as illustrated in the following scheme. See, for  
25 example, Berk et al., 1988.

Scheme 4

Again, examples of acylating agent,  $\text{R}^5\text{COX}$ , include esters, acid chlorides, anhydrides, and the like, and reactions may be catalysed, for example, by bases such as metal alkoxides, or by prior formation of an enolate anion, using, for example, lithium di-isopropylamide in tetrahydrofuran at low temperature. Alternatively the acylating agent may be a formamide or an orthoformate, used in the presence of a Lewis acid catalyst, such as  $\text{BF}_3$ .

Again, the alkyl benzyl ketone,  $\text{R}^5\text{C}(=\text{O})\text{CH}_2\text{Ar}^4$ , may be replaced by related substrates, such as enol ethers, shown below, where R is, for example, alkyl, trialkylsilyl, and the like.

In another method, the dicarbonyl compound is prepared by arylation of a 1,3-dicarbonyl compound, for example, as illustrated in the following scheme. See, for example,

Scheme 5

In favourable cases, anions derived from 1,3-diketones may be arylated directly by reaction with a haloaromatic compound,  $\text{Ar}_2\text{X}$ , where X is, for example, F, Cl, or Br. This method is especially useful when the aromatic ring,  $\text{Ar}^4$ , is electron deficient, as in, for example, groups such as 4-nitrophenyl and heteroraryl groups such as 4-pyridyl and 2-pyrimidinyl.

The required benzyl aryl ketones can be obtained by various synthetic approaches including, for example, the ones illustrated in the following schemes. See, for example, Berk et al., 1988; Hajipour et al., 1998; Anderson et al., 1997; Farkas et al., 2000; Wahala et al., 1991; Knchel et al., 1988; and Zhu et al., 1991.

10 General procedure of the preparation of the corresponding acetyl chlorides

The acid (e.g. Example 149) (ca. 5 mg) was dissolved in dried THF (2 mL); oxalyl chloride (2 mole-equiv) was added and followed by a drop of DMF. The solution was stirred at rt for a hour and then ready to be used.

General procedure of the preparation of the corresponding acetamides.

To the solution of the acid chloride in THF, conc.  $\text{NH}_3$  (1/2 mL) or the corresponding amines (1.5 mole-equiv), triethylamine (1.5 mole-equiv) and few crystals of DMAP were added. The solution was refluxed for one hour. It was then diluted with water (3 mL) and extracted with EtOAc (3 x 3 mL). The combined organic layers were washed with NaCl solution and dried with  $\text{Na}_2\text{SO}_4$ . After evaporation of the solvent, an oil was obtained which then was purified by chromatography; eluted with EtOAc : MeOH (7 : 1).

### Uses

The present invention provides active compounds, specifically, active  
5 3,4-diarylpyrazoles, as described herein, which are capable of inhibiting HSP90.

The present invention also provides methods of inhibiting HSP90, *in vitro* or *in vivo*, comprising contacting a cell with an effective amount of an active compound, as described herein. In one embodiment, the method is performed  
10 *in vitro*. In one embodiment, the method is performed *in vivo*.

The term "inhibiting HSP90," as used herein, includes: inhibiting HSP90 activity; inhibiting the formation of HSP90 complexes; inhibiting the activity of HSP90 complexes; inhibiting the ability of HSP90 to act upon a client protein; inhibiting  
15 the ability of HSP90 to act as a chaperone to a client protein; inhibiting the ability of HSP90 to facilitate conformational change (e.g., folding) of a client protein.

For example, one mode of HSP90 inhibition involves compounds which bind (e.g., competitively) at an HSP90 ATP binding site. Another mode involves  
20 compounds which instead, or in addition, bind elsewhere on the HSP90 molecule, on a client protein, on a co-chaperone, or a combination thereof.

The term "active," as used herein, pertains to compounds which are capable of inhibiting HSP90, and specifically includes both compounds with intrinsic activity  
25 (drugs) as well as prodrugs of such compounds, which prodrugs may themselves exhibit little or no intrinsic activity.

One of ordinary skill in the art is readily able to determine whether or not a candidate compound inhibits HSP90 activity. For example, assays which may  
30 conveniently be used in order to assess the HSP90 inhibition offered by a particular compound are described in the examples below.

- 114 -

The present invention also provides active compounds which inhibit the ATPase activity of HSP90.

5 The present invention also provides methods of inhibiting the ATPase activity of HSP90, *in vitro* or *in vivo*, comprising contacting a cell with an effective amount of an active compound, as described herein. In one embodiment, the method is performed *in vitro*. In one embodiment, the method is performed *in vivo*.

10 One of ordinary skill in the art is readily able to determine whether or not a candidate compound inhibits the ATPase activity of HSP90. For example, assays which may conveniently be used in order to assess the inhibition offered by a particular compound are described in the examples below.

15 The present invention also provides methods of inhibiting HSP90 in a cell, comprising contacting said cell with an effective amount of an active compound, preferably in the form of a pharmaceutically acceptable composition. Such a method may be practised *in vitro* or *in vivo*.

20 The present invention also provides active compounds which (a) inhibit cell proliferation; (b) inhibit cell cycle progression; (c) promote apoptosis; or (d) a combination of one or more of these.

25 Thus, the present invention also provides methods of (a) inhibiting cell proliferation; (b) inhibiting cell cycle progression; (c) promoting apoptosis; or (d) a combination of one or more of these, *in vitro* or *in vivo*, comprising contacting a cell with an effective amount of an active compound, as described herein

The present invention also provides active compounds which are useful in the treatment of a condition mediated by HSP90.

30

The term "a condition mediated by HSP90," as used herein pertains to a condition in which HSP90 and/or the action of HSP90 is important or necessary, e.g., for the onset, progress, expression, etc. of that condition. Examples of

- 115 -

conditions mediated by HSP90 include, but are not limited to, a condition characterised by HSP90 action upon a client protein which drives that condition; a condition characterised by one or more client proteins which are acted upon by HSP90; a condition driven by one or more proteins, which proteins are HSP90 client proteins, and which proteins could not drive the condition in the absence of action (e.g., chaperoning) by HSP90; a condition driven by one or more proteins, which proteins are HSP90 client proteins, and the action (e.g., chaperoning) by HSP90 in order to drive the condition.

Examples of such conditions include, but are not limited to: cancer; immunosuppressive applications such auto-immune disease; arthritis; prion diseases (e.g., Creutzfeld Jacob Disease (CJD), variant CJD); other diseases associated with defects in protein folding and aggregation (e.g., Alzheimer's disease, Huntingdon's disease).

For example, many oncoproteins are HSP90 client proteins. In the absence of the chaperoning action of HSP90, these proteins are degraded, for example, by ubiquitin dependent proteasome degradation. Similarly, LCK protein, characteristic of many autoimmune diseases, is also an HSP90 client protein. In the absence of the chaperoning action of HSP90, LCK levels are reduced.

Thus, in one embodiment, the present invention provides active compounds which are anticancer agents. The term "anticancer agent" as used herein, pertains to a compound which treats a cancer (i.e., a compound which is useful in the treatment of a cancer). The anti-cancer effect may arise through one or more mechanisms, including but not limited to, the regulation of cell proliferation, the inhibition of cell cycle progression, the inhibition of angiogenesis (the formation of new blood vessels), the inhibition of metastasis (the spread of a tumour from its origin), the inhibition of invasion (the spread of tumour cells into neighbouring normal structures), or the promotion of apoptosis (programmed cell death).

One of ordinary skill in the art is readily able to determine whether or not a candidate compound treats a cancerous condition for any particular cell type. For

- 116 -

example, assays which may conveniently be used to assess the activity offered by a particular compound are described in the examples below.

5 The present invention also provides active compounds which are antiproliferative agents. The term "antiproliferative agent" as used herein, pertain to a compound which treats a proliferative condition (i.e., a compound which is useful in the treatment of a proliferative condition).

10 One of ordinary skill in the art is readily able to determine whether or not a candidate compound treats a proliferative condition for any particular cell type. For example, assays which may conveniently be used to assess the activity offered by a particular compound are described in the examples below.

15 The terms "cell proliferation," "proliferative condition," "proliferative disorder," and "proliferative disease," are used interchangeably herein and pertain to an unwanted or uncontrolled cellular proliferation of excessive or abnormal cells which is undesired, such as, neoplastic or hyperplastic growth, whether *in vitro* or *in vivo*.

20 Examples of proliferative conditions include, but are not limited to, benign, pre-malignant, and malignant cellular proliferation, including but not limited to, neoplasms and tumours (e.g., histocytoma, glioma, astrocyoma, osteoma), cancers (e.g., lung cancer, small cell lung cancer, gastrointestinal cancer, bowel cancer, colon cancer, breast carinoma, ovarian carcinoma, prostate cancer, 25 testicular cancer, liver cancer, kidney cancer, bladder cancer, pancreas cancer, brain cancer, sarcoma, osteosarcoma, Kaposi's sarcoma, melanoma), leukemias, psoriasis, bone diseases, fibroproliferative disorders (e.g., of connective tissues), and atherosclerosis.

30 Any type of cell may be treated, including but not limited to, lung, gastrointestinal (including, e.g., bowel, colon), breast, ovarian, prostate, liver (hepatic), kidney (renal), bladder, pancreas, brain, and skin.

- 117 -

The invention further provides a method of treatment of the human or animal body, the method comprising administering to a subject in need of treatment a therapeutically-effective amount of an active compound, preferably in the form of a pharmaceutical composition.

5

The term "treatment," as used herein in the context of treating a condition, pertains generally to treatment and therapy, whether of a human or an animal (e.g., in veterinary applications), in which some desired therapeutic effect is achieved, for example, the inhibition of the progress of the condition, and  
10 includes a reduction in the rate of progress, a halt in the rate of progress, amelioration of the condition, and cure of the condition. Treatment as a prophylactic measure (i.e., prophylaxis) is also included.

The term "therapeutically-effective amount," as used herein, pertains to that  
15 amount of an active compound, or a material, composition or dosage form comprising an active compound, which is effective for producing some desired therapeutic effect, commensurate with a reasonable benefit/risk ratio.

The term "treatment" includes combination treatments and therapies, in which  
20 two or more treatments or therapies are combined, for example, sequentially or simultaneously. Examples of treatments and therapies include, but are not limited to, chemotherapy (the administration of active agents, including, e.g., drugs, antibodies (e.g., as in immunotherapy), prodrugs (e.g., as in photodynamic therapy, GDEPT, ADEPT, etc.); surgery; radiation therapy; and gene therapy.

25

The invention further provides active compounds for use in a method of treatment of the human or animal body, for example, in the treatment of a condition mediated by HSP90, such as cancer or other condition as described above.

30 The invention further provides the use of an active compound for the manufacture of a medicament, for example, for the treatment of a condition mediated by HSP90, such as cancer or other condition as described above.

Active compounds may also be used as cell culture additives to inhibit HSP90.

Active compounds may also be used, as described above, in combination therapies, that is, in conjunction with other agents, for example, cytotoxic agents.

5

Active compounds may also be used as part of an *in vitro* assay, for example, in order to determine whether a candidate host is likely to benefit from treatment with the compound in question.

10 Active compounds may also be used as a standard, for example, in an assay, in order to identify other active compounds, other HSP90 inhibitors, other anticancer agents, etc.

#### Formulations

While it is possible for the active ingredient to be administered alone, it is preferable to present it as a pharmaceutical composition (e.g., formulation)

15

comprising at least one active ingredient, as defined above, together with one or more pharmaceutically acceptable carriers, excipients, buffers, adjuvants, stabilisers, or other materials well known to those skilled in the art and optionally other therapeutic agents.

20

Thus, the present invention further provides pharmaceutical compositions, as defined above, and methods of making a pharmaceutical composition comprising admixing at least one active ingredient, as defined above, together with one or more pharmaceutically acceptable carriers, excipients, buffers, adjuvants, stabilisers, or other materials, as described herein.

25

The term "pharmaceutically acceptable" as used herein pertains to compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of a subject (e.g., human) without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio. Each carrier, excipient, etc. must also be "acceptable" in the sense of being compatible with the other ingredients of the formulation.

30

- 121 -

The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. Such methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more accessory ingredients. In general, the

- 5 formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

- 10 Formulations may be in the form of liquids, solutions, suspensions, emulsions, tablets, lozenges, granules, powders, capsules, cachets, pills, ampoules, suppositories, pessaries, ointments, gels, pastes, creams, sprays, foams, lotions, oils, boluses, electuaries, or aerosols.

- 15 Formulations suitable for oral administration (e.g., by ingestion) may be presented as discrete units such as capsules, cachets or tablets, each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion; as a bolus; as an electuary; or as a paste.

20

- A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder (e.g., povidone, gelatin, hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (e.g., sodium starch glycolate, cross-linked povidone, cross-linked sodium carboxymethyl cellulose), surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile. Tablets
- 25
- 30

may optionally be provided with an enteric coating, to provide release in parts of the gut other than the stomach.

Formulations suitable for topical administration (e.g., transdermal, intranasal, ocular, buccal, and sublingual) may be formulated as an ointment, cream, suspension, lotion, powder, solution, paste, gel, spray, aerosol, or oil. Alternatively, a formulation may comprise a patch or a dressing such as a bandage or adhesive plaster impregnated with active ingredients and optionally one or more excipients or diluents.

Formulations suitable for topical administration in the mouth include lozenges comprising the active ingredient in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent for the active ingredient.

Formulations suitable for nasal administration, wherein the carrier is a solid, include a coarse powder having a particle size, for example, in the range of about 20 to about 500 microns which is administered in the manner in which snuff is taken, i.e., by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid for administration as, for example, nasal spray, nasal drops, or by aerosol administration by nebuliser, include aqueous or oily solutions of the active ingredient.

Formulations suitable for topical administration via the skin include ointments, creams, and emulsions. When formulated in an ointment, the active ingredient may optionally be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an

oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example, at least about 30% w/w of a polyhydric alcohol, i.e., an alcohol having two or more hydroxyl groups such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol and mixtures thereof.

- 5 The topical formulations may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogues.
- 10 When formulated as a topical emulsion, the oily phase may optionally comprise merely an emulsifier (otherwise known as an emulgent), or it may comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabiliser. It is also preferred to include both an oil and a fat.
- 15 Together, the emulsifier(s) with or without stabiliser(s) make up the so-called emulsifying wax, and the wax together with the oil and/or fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations.
- 20 Suitable emulgents and emulsion stabilisers include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate and sodium lauryl sulfate. The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations
- 25 may be very low. Thus the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl
- 30 stearate, 2-ethylhexyl palmitate or a blend of branched chain esters known as Crodamol CAP may be used, the last three being preferred esters. These may be used alone or in combination depending on the properties required.

Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for rectal administration may be presented as a suppository  
5 with a suitable base comprising, for example, cocoa butter or a salicylate.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredient, such carriers as are known in the art to be  
10 appropriate.

Formulations suitable for parenteral administration (e.g., by injection, including cutaneous, subcutaneous, intramuscular, intravenous and intradermal), include aqueous and non-aqueous isotonic, pyrogen-free, sterile injection solutions which  
15 may contain anti-oxidants, buffers, preservatives, stabilisers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents, and liposomes or other microparticulate systems which are designed to target the compound to blood  
20 components or one or more organs. Examples of suitable isotonic vehicles for use in such formulations include Sodium Chloride Injection, Ringer's Solution, or Lactated Ringer's Injection. Typically, the concentration of the active ingredient in the solution is from about 1 ng/ml to about 10 µg/ml, for example from about 10 ng/ml to about 1 µg/ml. The formulations may be presented in unit-dose or multi-  
25 dose sealed containers, for example, ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use.

Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets. Formulations may be in the form of  
30 liposomes or other microparticulate systems which are designed to target the active compound to blood components or one or more organs.

### Dosage

It will be appreciated that appropriate dosages of the active compounds, and compositions comprising the active compounds, can vary from patient to patient.

- 5 Determining the optimal dosage will generally involve the balancing of the level of therapeutic benefit against any risk or deleterious side effects of the treatments of the present invention. The selected dosage level will depend on a variety of factors including, but not limited to, the activity of the particular compound, the route of administration, the time of administration, the rate of excretion of the
- 10 compound, the duration of the treatment, other drugs, compounds, and/or materials used in combination, and the age, sex, weight, condition, general health, and prior medical history of the patient. The amount of compound and route of administration will ultimately be at the discretion of the physician, although generally the dosage will be to achieve local concentrations at the site
- 15 of action which achieve the desired effect.

- Administration *in vivo* can be effected in one dose, continuously or intermittently throughout the course of treatment. Methods of determining the most effective means and dosage of administration are well known to those of skill in the art and
- 20 will vary with the formulation used for therapy, the purpose of the therapy, the target cell being treated, and the subject being treated. Single or multiple administrations can be carried out with the dose level and pattern being selected by the treating physician.

- 25 In general, a suitable dose of the active compound is in the range of about 0.1 to about 250 mg per kilogram body weight of the subject per day. Where the active ingredient is a salt, an ester, prodrug, or the like, the amount administered is calculated on the basis the parent compound and so the actual weight to be used is increased proportionately.

### Kits

- One aspect of the invention pertains to a kit comprising (a) the active ingredient, preferably provided in a suitable container and/or with suitable packaging; and
- 5 (b) instructions for use, for example, written instructions on how to administer the active compound, etc.

The written instructions may also include a list of indications for which the active ingredient is a suitable treatment.

Nuclear magnetic resonance spectroscopy (NMR) was carried out using a 300 or 400MHz Bruker and were recorded in deuteriated solvents.

Microwave experiments were conducted using a CEM Discover Synthesis Unit or Smith Personal Synthesiser. These machines provide a continuous focused microwave delivery system.

For the CEM system the power output can be varied from 0 to 300 W. Reactions were performed in glass vessels (ca. 10 ml) sealed with a septum. The pressure was monitored by a gauge needle penetrated through the septum, and the temperature by an infrared probe at the bottom of the glass vessel. All experiments were performed under stirring option. Melting points were determined with an Electrothermal apparatus and are uncorrected. All the yields have not been optimised.

### Preparation of Phenylacetic acids for Examples 49,61,62,63,68,70,71,153-157

**2,3-Dihydro-benzo[1,4]dioxin-6-yl)-acetic acid** – 3,4-Dihydroxyphenyl acetic acid (5.08g, 30.2 mmol) and potassium carbonate (12.5g, 3.0 equiv) were dissolved in a mixture of acetone (80ml) and water (80ml) and refluxed for 1 hour before 1,2-dibromoethane (3.4ml, 1.3 equiv) was added. The mixture was then

- 128 -

refluxed for 36 hrs with rapid stirring. After cooling the acetone was removed under vacuum and the neutrals extracted with ether (1 x 50ml). The aqueous layer was acidified with 3M HCl and extracted with EtOAc (40ml x 3), the last extraction being performed after the aqueous layer had been saturated with NaCl. The EtOAc extractions were combined, dried over Na<sub>2</sub>SO<sub>4</sub> and the solvent removed to leave a brown viscous oil. This was dissolved in a small amount of DCM and purified by column chromatography using a 95/5 DCM/EtOH mixture as the elution solvent. The appropriate fractions provided 2.8g (48% yield) of the product as an off white coloured powder.

$\delta_H$  (CDCl<sub>3</sub>), 8.86 (1H, broad, CO<sub>2</sub>H), 6.67 (3H, m, Ar-H), 4.16 (4H, s, O-CH<sub>2</sub>CH<sub>2</sub>-O), 3.45 (2H, s, CH<sub>2</sub>CO<sub>2</sub>H). LCMS  $t_R$  = 5.38, MS  $m/z$  193.3 [M-H]<sup>-</sup>.

**[4-(3-Cyano-propoxy)-phenyl]-acetic acid** – 4-hydroxyphenyl acetic acid (3.5g, 23mmol) and potassium hydroxide (3.9g, 3.0 equiv.) were dissolved in MeOH (100ml) and stirred for 1 hour before the 4-bromobutyronitrile (10g, 3 equiv.) was added. The mixture was refluxed overnight before more KOH (3.7g) in MeOH was added and refluxed for a further hour before cooling. The mixture was poured into water (100ml), washed with EtOAc (2 x 20ml), acidified using 5M HCl. The resulting white precipitate was filtered off and the filtrate extracted with DCM (2x 30ml). The DCM extractions were combined, washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness provided 3.78g (75% yield) of the pure product as a white powder.

$\delta_H$  (CDCl<sub>3</sub>), 7.24 (2H, d, Ar-H), 6.86 (2H, d, Ar-H), 4.11 (2H, t, OCH<sub>2</sub>), 3.61 (2H, s, CH<sub>2</sub>CO<sub>2</sub>H), 2.60 (2H, t, CH<sub>2</sub>CN), 2.10 (2H, m, CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>). An ethanolic solution (5ml) of 3-(4-Bromo-phenyl)-6-chloro-7-hydroxy-chromen-4-one (100mg, 28mmol) was heated to boiling, methyl hydrazine (0.30ml, 20 equiv.) added in one portion, and refluxing continued for 16 hrs. 20

Several examples of compounds of the present invention were obtained from commercial sources (e.g., ChemDiv Inc., San Diego, California, USA).

HSP90 activity was determined using, *inter alia*, the assays described below.

25

Assay Methods

Two methods have been developed to measure the intrinsic ATPase activity of HSP90, using yeast HSP90 as a model system. The first method utilises a

- 238 -

regenerating coupled enzyme assay. The second assay, based on the use of malachite green for the measurement of inorganic phosphate, was designed for high throughput screening (HTS) to identify novel HSP90 inhibitor drug candidates.

5

Molecular markers, indicative of HSP90 inhibition, have been identified (see, e.g., Whitesell et al., 1994; Clarke et al., 2000) and these can be readily measured using Western blotting techniques.

- 10 A cell-based ELISA (enzyme-linked immunosorbent assay), similar to those described for other proteins and post-translational modifications (see, e.g., Stockwell et al., 1999; Versteeg et al., 2000), has also been developed. This technique provides an alternative higher throughput assay for determining pharmacodynamic endpoints for the evaluation of HSP90 inhibitors. The assay
- 15 may also prove useful as a cell-based primary screen for the identification of compounds that inhibit HSP90 by a non-ATPase directed mechanism.

A growth inhibition assay was also employed for the evaluation of candidate HSP90 inhibitors.

#### Coupled Enzyme ATPase Assay

The ATPase assay is performed using the pyruvate kinase/ lactate dehydrogenase linked assay described by Ali et al, 1993, the basis of which is

25 illustrated in the following scheme:

- 239 -

The ADP that is generated by HSP90 is phosphorylated by pyruvate kinase, utilising phosphoenol pyruvate (PEP) as substrate, to produce ATP and pyruvate as products. Pyruvate is then converted to lactic acid by lactate dehydrogenase  
5 utilising NADH, which is converted to NAD. This consumption of NADH concentration leads to a decrease in the absorbance at 340 nm that is monitored spectrophotometrically. Thus, for every mole of ADP that is generated by the ATPase activity of HSP90, one mole of NADH is utilised. It should be noted that prior to the addition of HSP90, the enzyme system converts any contaminating  
10 ADP, which is present in the ATP substrate, to ATP. This is important for enzymes such as HSP90, which show a stronger affinity for the binding of ADP than ATP.

Chemicals are of the highest purity commercially available and all aqueous solutions are made up in AR water.

- (1) 1 M Tris-HCl buffer, pH 7.5.
- 20 (2) 100 mM KCl.
- (3) 100 mM MgCl<sub>2</sub>.
- (4) 10 mg ml<sup>-1</sup> phosphoenol pyruvate (PEP, 108 294, Roche Diagnostics Ltd., Lewes, UK) stored at 4°C.
- (5) 4 mg ml<sup>-1</sup> ATP (A-9187, Sigma Aldrich Ltd., Poole, UK) stored at -20°C
- 25 (6) 35.5 mg ml<sup>-1</sup> NADH (837 075, Roche Diagnostics Ltd.) stored at 4°C.
- (7) 10 mg ml<sup>-1</sup> pyruvate kinase (109 045, Roche Diagnostics Ltd.) stored at 4°C.
- (8) 10 mg ml<sup>-1</sup> lactate dehydrogenase (127 221, Roche Diagnostics Ltd.) stored at 4°C.
- 30 (9) 15 mM geldanamycin (in 100% DMSO) freshly prepared.

## Method

The following protocol was used:

- (1) Mix together: (a) 10 ml of 1 M Tris buffer pH 7.5, (b) 20 ml 100 mM KCl  
5 and (c) 6 ml of 100 mM  $\text{MgCl}_2$ . This is buffer A and is kept at 37°C for the duration of the assay and then discarded at the end of each day.
- (2) Incubate some distilled water ( $\text{dH}_2\text{O}$ ) at 37°C.
- (3) Dissolve 12.8 mg of ATP in 2 ml of buffer A and maintain on ice.
- (4) Dissolve 10 mg of PEP in 1 ml of buffer A and incubate on ice.
- 10 (5) Add 0.25 ml buffer A to 8.9 mg NADH and place on ice.
- (6) Place the pyruvate kinase and lactate dehydrogenase on ice.
- (7) To the reference cell, add (a) 360  $\mu\text{l}$  buffer A, (b) 520  $\mu\text{l}$   $\text{dH}_2\text{O}$ , (c) 80  $\mu\text{l}$  ATP solution and (d) 40  $\mu\text{l}$  PEP solution.
- (8) To the test cells, add (a) 360  $\mu\text{l}$  buffer A, (b) 490  $\mu\text{l}$   $\text{dH}_2\text{O}$ , (c) 80  $\mu\text{l}$  ATP,  
15 (d) 40  $\mu\text{l}$  PEP, (e) 20  $\mu\text{l}$  pyruvate kinase and (f) 2  $\mu\text{l}$  lactate dehydrogenase.
- (9) Mix the contents of the cuvettes and zero the absorbance at 340 nm. Then add 2  $\mu\text{l}$  of the NADH and the absorbance should increase. Follow the reaction at 37 °C until a stable base line is obtained.
- (10) Add the HSP90 to the test cuvettes and adjust the volume of the cuvettes  
20 to 1 ml with  $\text{dH}_2\text{O}$ , and follow the decrease in the absorbance at 340 nm using a suitable spectrophotometer (e.g., Shimadzu UV-240).
- (11) Add 2  $\mu\text{l}$  of geldanamycin and follow the decrease in the absorbance at 340 nM. The HSP90 ATPase activity is given by the difference between the rates in steps 9 and 10.
- 25 (12) The rate of the reaction ( $\text{moles min}^{-1} \text{ ml}^{-1}$ ) is derived from  $\Delta\text{OD} / (1000 \times 6200 \text{ M}^{-1} \text{ cm}^{-1})$ , where the value 6200 is the extinction coefficient of NADH. This can be converted to specific activity ( $\text{mole ATP min}^{-1} \text{ mg}^{-1}$ ) or turnover ( $\text{moles min}^{-1} \text{ mole}^{-1}$ ) by dividing the rate by the mass (mg) or molar amount of HSP90 used in the reaction.

## Comments

- (1) Details of the purification of the yeast HSP90 protein have previously been described (Panaretou et al., 1998). The ATPase activity of yeast HSP90 at 37°C is ~0.7 moles ATP min<sup>-1</sup> mg protein. Relative to other ATPases, this activity is very low and consequently HSP90 preparations must be highly purified.
- (2) To show that the measured ATPase activity is due to HSP90, rather than background contaminating ATPase activity, the activity must be shown to be geldanamycin sensitive.
- (3) All assays are conducted in triplicate with a HSP90 concentration of 2 µM.
- (4) This assay is relatively time consuming and throughput is consequently low. Each assay takes around 60 min to complete.

15 Malachite Green ATPase Assay

Colorimetric assays for the determination of phosphate, based on the formation of a phosphomolybdate complex, can be carried out in a few steps with inexpensive reagents and are well suited to the automation required for high throughput screening (see, e.g., Cogan et al., 1999). Enzymes that release inorganic phosphate are assayed using the reaction of the cationic dye, malachite green, with the a complex formed by a reaction of the inorganic phosphate with molybdate to generate a blue-green colour with an absorbance maximum at 610nm (see, e.g., Baykov et al., 1988; Harder et al., 1994; Maehama et al., 2000). The method has been used in both high throughput (see, e.g., Rumsfeld et al., 2000) and ultra-high throughput screening formats (see, e.g., Lavery et al., 2001) for a variety of non-HSP90 ATPases. However, this method is complicated by the non-enzymatic hydrolysis of ATP in the presence of acidic malachite green reagent, causing an increase in colour (see, e.g., Chan et al., 1986; Henkel et al., 1988). This process is mediated by molybdate and can be overcome by the addition of sodium citrate immediately after the reagent (see, e.g., Lanzetta et al., 1979; Schirmer et al., 1998; Baginski et al., 1975). This modification has been adapted to the 96-well microtitre plate assay previously described for other

- 242 -

ATPases (see, e.g., Lanzetta et al., 1979) to produce the following protocol for HSP90 ATPase, which is suitable for high throughput screening.

Chemicals are of the highest purity commercially available and all aqueous solutions are made up in AR water. Because of the need to minimise contamination with inorganic phosphate, precautions should be taken with solutions and apparatus used in the assays. Glassware and pH meters are  
10 rinsed with double distilled or deionised water before use and, wherever possible, plastic ware should be used. Gloves are worn for all procedures.

30

## Method

The following protocol was used:

- 5 (1) On the day of use, prepare the malachite green reagent from the stock solutions. Mix (a) 2 parts of malachite green, (b) 1 part of polyvinyl alcohol, (c) 1 part of ammonium molybdate, and (d) 2 parts of water. Initially, the reagent is a dark brown colour, but after standing at room temperature for about 2 h, this becomes a golden yellow colour and is ready for use.
- 10 (2) For the high throughput screening assays, the test compounds are dissolved at 200  $\mu$ M in 2.0% DMSO and contained in daughter plates derived from the chemical libraries. Transfer 5  $\mu$ l of each sample from the daughter plate to each well of the assay plate using automated equipment (see Comment 3). This represents a final concentration in the well of  
15 40  $\mu$ M. The first and last rows of the 96-well plate contain solvent only and represent the control and background values, respectively.
- (3) In order to determine an IC<sub>50</sub> value, prepare a range of stock concentrations of the compound in DMSO. Five appropriate  
20 concentrations are used depending on the relative potency of each compound. Transfer a 1  $\mu$ l aliquot of each concentration to the wells of the assay plate and add 4  $\mu$ L of the assay buffer.
- (4) Dissolve the ATP in the assay buffer to give a stock concentration of 2.5 mM and store at room temperature.
- (5) Add a 10  $\mu$ l aliquot of the ATP solution to each well to give a final assay  
25 concentration of 1 mM.
- (6) Just before use, thaw the HSP90 protein on ice and suspend in chilled assay buffer to a stock concentration of 0.25 mg/ml and keep on ice. Start the incubation by adding 10  $\mu$ l of stock HSP90 to each well, except for the background wells which receive 10  $\mu$ l of assay buffer, giving a final assay  
30 volume of 25  $\mu$ l.

- 244 -

- (7) Shake the plates (approximately 2 min) using a plate shaker (e.g., Wellmixx (Thermo Labsystems) or MTS4 (IKA-Schuttler)), seal with plastic film and incubate for 3 h at 37°C.
- (8) To stop the incubation, add 80 µl of the malachite green reagent to each well and shake the plate again.
- (9) Add 10 µl of 34% sodium citrate (see Comment 2) to each well and shake again. This leads to the development of the blue-green colour in the controls, while the backgrounds are yellowish.
- (10) Measure the absorbance at 620 nm using a suitable plate reader (e.g., Victor 2, Perkin Elmer Life Sciences, Milton Keynes, UK). Under the above conditions, the control absorbance value is 0.7 to 1.0, while the background is 0.15 to 0.20; the signal to noise ratio is ~30. The Z' factor (see, e.g., Zhang et al., 1999) calculated from data obtained using these conditions was 0.8 indicating an assay highly suitable for screening purposes.

#### Comments

- (1) The polyvinyl alcohol dissolves in boiling water with difficulty and stirring for 2-3 h is required.
- (2) The time interval between addition of the malachite green reagent and the sodium citrate should be kept as short as possible in order to reduce the non-enzymatic hydrolysis of ATP. Once the sodium citrate is added, the colour is stable for up to 4 h at room temperature.
- (3) Compounds can be added to the assay plates using a Rapidplate 96/384 (Zymark, Runcorn, UK). A Multidrop 384 dispenser (Thermo Labsystems, Basingstoke, UK) can be conveniently used to add reagents to the plate.
- (4) The assay conditions were optimised with respect to time, protein and substrate concentration in order to achieve linearity of enzyme activity under the described protocol.
- (5) The above assay protocol is used with 96-well plates, but a reduction in volumes readily allows the use of 384-well plates.

- 245 -

(6) Signal to noise (S/N) is calculated using the following equation:

$$(S-B)/\sqrt{(SD\text{ of }S)^2 + (SD\text{ of }B)^2}$$

(7) To determine specific activity of HSP90, a range of inorganic phosphate concentrations (0-10  $\mu$ M) are prepared and the absorbance at 620 nm measured as described. Specific activity is calculated from the resulting calibration curve.

### Western Blotting Assay

10 The cellular effects of HSP90 inhibitors can be measured using a number of molecular markers. As already mentioned, HSP90 inhibition leads to the depletion of several important cellular signalling proteins. RAF-1 is readily detectable by Western blotting and has been shown to be depleted in a number of human tumour cell lines following exposure to HSP90 inhibitors (see, e.g.,  
15 Kelland et al., 1999; Hostein et al., 2001; Schulte et al., 1998; Clarke et al., 2000). Depletion is normally observed by 6 h, with maximum depletion occurring at 24 h. As well as RAF-1, depletion of several other HSP90 client proteins can be measured by immunoblotting e.g., CDK4, ERBB2. However, it is important to note that some of these proteins are cell line specific e.g., ERBB2 is expressed  
20 mainly in breast, thyroid, kidney and some ovarian tumour cell lines. Another very important marker of HSP90 inhibition is heat shock protein 70 (HSP70). A HSF-1 (heatshock factor 1) dependent increase in HSP70 levels has been reported by us and other groups (see, e.g., Whitesell et al., 1994; Clarke et al., 2000) and this effect can serve as a positive indicator of HSP90 inhibitor action. The  
25 immunoblotting method described is based on standard techniques but is described in detail for ease of reference.

## 5 Comments

- (1) The protein bands are normally evaluated visually. Densitometry has proved to be an unreliable method for the evaluation of HSP70 expression as the intensity of the band can exceed the linear range of the photographic film.
- (2) It is important to note when choosing the time points for the experiment that in some cell lines RAF-1 protein levels recover after 24 h.
- (3) Western blotting is currently being utilised in a 17AAG Phase I clinical trial to analyse these pharmacodynamic markers in peripheral blood lymphocytes and tumour tissue to determine whether the compound is acting via its proposed mechanism of action.
- (4) RAF-1 is not expressed in all peripheral blood lymphocytes and shows inter-patient variation (unpublished observations). It has been determined that another marker for examining client protein depletion in peripheral blood lymphocytes is the tyrosine kinase, LCK.
- (5) Increased expression of HSP70 following HSP90 inhibition can also be measured at the messenger RNA level. Such a methodology for determining the affects of HSP90 inhibitors on the expression of HSP70 and other genes using microarray analysis has been published (see, e.g., Clarke et al., 2000).

## ELISA

Although Western blotting has become a universally used technique for evaluating the level of protein expression in cell lines and tissue lysates, the number of samples that can be included on each gel is limited. In addition, relatively large numbers of cells are required to detect proteins that are expressed at a low level and precise quantitation is difficult.

Cell-based ELISA methods (see, e.g., Stockwell et al., 1999; Versteeg et al., 2000) offer several advantages for evaluating the pharmacodynamic effects of novel mechanism-based inhibitors and may be the method of choice for comparing inhibitors that are identified during the iterative process of lead identification and optimisation. The technique can be used to rapidly rank the effectiveness of compounds as well as to investigate the molecular mechanisms of their action. The increased sample throughput possible with ELISA means that compounds can be simultaneously studied in multiple replicates at different doses and exposure times. Also, the number of cells required per observation can be greatly reduced compared to those required for immunoblotting. The assays are carried out directly on cells grown and treated in microtitre plates, thereby removing the necessity for preparing cell lysates. ELISA techniques can in theory be applied to any cellular protein or post-translational modification for which an antibody is available and results are at least semi-quantitative.

- (4) Incubate cells in the presence of DMSO or compound for up to 48 h.
- (5) "Flick out" medium by hand and fix and permeabilise the cells by the addition of 100 µl fixing solution. Incubate at 37° for 30 min.
- 25 (6) Wash plates twice in PBS using an automated washer (Wellwash 5000 ten plate stacker-washer or Wellwash Ascent single plate washer, Thermo Labsystems, Basingstoke, UK).
- (7) Block the plates by addition of blocking solution (100 µl) and incubate for 30 min.
- 30 (8) Add 100 µl primary antibody diluted to 0.95 µg/ml in PBS to each well and incubate plate for 1.5 h. Wash plates once with DELFIA<sup>®</sup> wash solution.

- 251 -

- (9) Add 100 µl Europium labelled anti-mouse IgG diluted in DELFIA<sup>®</sup> assay buffer to 75 ng/ml and incubate for 1 hour. Wash plates once with DELFIA<sup>®</sup> wash solution as before.
- (10) Add 100 µl DELFIA<sup>®</sup> enhancement solution to each well.

- (13) Express ELISA results by normalising to protein in the well (Eu counts (cpm) divided by OD @570 nm). Compare the effect of HSP90 inhibitors on HSP70 expression with DMSO treated controls.

15 Comments

- (1) Cells plated into 96 well plates are incubated in a plastic box to reduce evaporation from the outside wells. In addition, ELISA incubation steps are carried out in a 37°C laboratory incubator and in a moist environment
- 20 e.g., plastic box lined with damp tissue paper.
- (2) All additions to the microtitre plate can be achieved using a multichannel pipette or for larger numbers of plates an automated dispenser such as a Multidrop (Thermo Labsystems, Basingstoke, UK).
- (3) For convenience, if the effects of compounds are being studied at several
- 25 time points the ELISA can be carried out in batches, plates being stored (in a container) at 4°C following the fixation step. In this case the plates are washed only once following fixation and again immediately before the first ELISA step (step 6 above). In addition all the plates can be stored for subsequent protein estimation.
- 30 (4) Reproducibility of both the measured Europium counts and the protein measurements was between 10-15% (CV).

- 252 -

- (5) DELFIA<sup>®</sup> reagents (see, e.g., Hemmila and Webb, 1997) have been routinely used in cell-based ELISAs. This endpoint provides high sensitivity and the time-resolved measurements reduce interference from non-specific fluorescence. However, it is also possible to use a horse  
5 radish peroxidase second antibody conjugate and either a colorimetric (e.g., tetramethylbenzidine) or chemiluminescent reagent (e.g., ECL reagent (Amersham Pharmacia Biotech, Little Chalfont, Bucks, UK) for endpoint measurement.
- (6) It is recommended that a blank consisting of second-antibody only (i.e., no  
10 first antibody) together with an appropriate first antibody control (e.g., isotype matched IgG) are included in assays during the process of optimising reagent concentrations.

#### Growth Inhibition Assay

15

The growth inhibition assay employed was based on that described previously (Kelland et al., 1993). HCT116 and HT29 human colon tumour cells (American Tissue Culture Collection) were seeded into 96-well tissue culture plates (approximately 1600-2000 cells per well) and allowed to attach for 36 hours.

20

Eight wells were treated with a single concentration from a range of compound concentrations and incubated for 96 hours. Cells were fixed using ice cold 10% trichloroacetic acid (TCA). Plates were then washed five times with water, air dried, and stained with 0.4 % sulphorhodamine B (SRB) in 1% acetic acid for 10 minutes. The SRB stain was solubilised in 10 mM Tris-HCl and the absorbance

25

measured at 540 nm using a Titertek Multiscan MCC/340 MKII plate reader (Flow Laboratories, IEC, Basingstoke, Hampshire). The absorbance values correspond to total protein content and are used as a measure of cell growth. These values were plotted on log/linear graph paper and the IC<sub>50</sub> was calculated as the drug concentration that inhibits cell growth by 50 % compared with control cell growth.

Biological DataMalachite Green ATPase Assay

- 5 The inhibition of HSP90 ATPase activities ( $IC_{50}$ ,  $\pm SD$ , if  $n = 3-5$ ) for several compounds of the present invention, assessed using the malachite green assay described above, are summarised in the following table. A substrate concentration of 1 mM ATP ( $K_m = 0.44$  mM) was used. Values for geldanamycin and 17AAG are included for comparison. In the coupled enzyme assay,
- 10 geldanamycin has an  $IC_{50}$  of 5  $\mu M$ .

Western Blotting Assay

- 15 The effect of CCT018159 on HSP70 and client protein (CDK4) expression was assessed using the Western blotting assay, as described above. The elevation of HSP70 following exposure to the compound (also observed using the cell-based ELISA) was confirmed.
- 20 Figure 1 is an immunoblot showing expression of HSP70 (induced) and RAF-1 (depleted) at various times following exposure of A2780 human ovarian cancer cells to 17AAG (60 nM equivalent to 5 x  $IC_{50}$ ).

Figure 2 is an immunoblot showing expression of CDK4 (depleted), HSP70 (induced), and GAPDH at 24 hours following exposure of HT29 cells to various concentrations of CCT018159 and 17AAG.

5

In HT29 cells, CCT018159 elevated HSP70 expression. The extent to which this protein was elevated following exposure to compound was similar to that observed for 17AAG. Glyceraldehyde phosphate dehydrogenase (GAPDH) was used to compare protein loading in each lane.

10

At the same time points and using the same concentration of compound, the client protein CDK4 was depleted. These results are similar to those observed with 17AAG and other HSP90 inhibitors (Kelland et al., 1999; Hostein et al., 2001; Schulte et al., 1998).

15

#### ELISA

The effect of various compounds of the present invention on the expression of the molecular marker HSP70 was determined using the cell-based ELISA and a specific monoclonal antibody to HSP70 in HCT116 cells, as described above. The results are summarised in the following table. Cellular protein following compound exposure was determined using BCA assay as described in the method.

The results show that, in HCT116 cells, HSP70 was induced up to 2.8-fold, following exposure to CCT018159 (10  $\mu$ M) for 48 h. At the same time, cellular protein measured by BCA was reduced by 50-80% of DMSO controls. These results were similar to those obtained with geldanamycin (1  $\mu$ M). This is indicative of cell growth inhibition at a compound concentration that also results in depletion of client proteins and elevation of HSP90.

#### Growth Inhibition Assay

The effects of various compounds of the present invention on the growth of HCT116 and HT29 human colon tumour cell lines, assessed using the growth inhibition assay described above, are summarised in the following table.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

## Continuation of Box I.2

The present claims relate to a method of treatment defined by reference to a result to be achieved, namely the inhibition of a biological mechanism (HSP90). The claims cover all diseases having this characteristic or property, whether this is presently known or not, whereas the application provides support within the meaning of Article 6 PCT for only one specific family of diseases, i.e. cancer. In the present case, the claims so lack support that a meaningful search over the whole of the claimed scope is impossible, not the least since the latter is open-ended. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT):

- (i) because of the large number of independent claims of the same category;
- (ii) because of the overall structure of the claims, with dependent claims overlapping each other rather than representing a progressive narrowing in scope and

Consequently, the search has been carried out for those parts of the claims which appear to be clear and supported, namely those parts relating to the compounds of the general Formula (1) and their use for the treatment of cancer in general.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 1-1-102, 104, 106 and 107 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
